

# An empirical model linking physico-chemical biomaterial characteristics to intraoral bone formation

Created on: 08-06-2023 - Last modified on: 08-06-2023

### **Contact person**

Ehsan Sadeghian

### Organisation

Name of the organisation University of Liège (ULiège)

Department GIGA in silico medicine

Specific Research Group or Service Biomechanics Research Unit

Country Belgium

### Partners and collaborations

Katholieke Universiteit Leuven (KUL), University of Liège (ULiège), Université Catholique de Louvain (UCL)

## SCOPE OF THE METHOD

The Method relates to	Animal health, Human health
The Method is situated in	Basic Research
Type of method	In silico
Species from which cells/tissues/organs are derived	bilateral sinus lift procedures in rabbits
Type of cells/tissues/organs	Intra-oral bone region

## **DESCRIPTION**

# **Method keywords**

Empirical modeling intra-oral bone formation calcium phosphate physico-chemical biomaterials

## Scientific area keywords

Bone tissue engineering Intra-oral bone regeneration insilico medicine physico-chemical characterization scaffold design

### **Method description**

This empirical model is used to assess the weighted value of driving biomaterials properties in the intra-oral bone regeneration process. We used partial least square regression (PLSR) to construct empirical models that relate combinations of (quantified) biomaterial characteristics to intra-oral bone regeneration outcomes across diverse types of bone biomaterials. This computational method uses linear correlation to reduce the dispersion of a multi-variate data set by identifying the most important information from the original data set.

# Lab equipment

Any characterization method that provides a quantified physico-chemical specification of scaffolds (e.g. mechanical characterization, surface roughness analysis, macroporosity measurement, etc.).

#### **Method status**

Internally validated

# PROS, CONS & FUTURE POTENTIAL

# Advantages

The model provides a way to identify driving biomaterial properties and morphological cues of the intra-oral bone healing process as well as predict the bone regeneration potential of new biomaterials based on their physico-chemical characteristics.

# Challenges

The model should be fed with the quantified characteristics of scaffolds obtained from high-quality characterizations.

### **Modifications**

More samples with a wider range of physico-chemical characteristics would further increase the robustness of the model.

### **Future & Other applications**

Biological agents (drugs, growth factors, etc.) could be drawn into the analysis in future research. The interplay between physico-chemical biomaterial factors and biological ones could also be assessed quantitatively for the intra-oral bone biomaterials. This model can be also applied to other areas of tissue engineering.

#### Other remarks

Designing the optimized bone graft for intra-oral applications involves many parameters that directly affect the bone regeneration rate in the defect site. Thus, in order to obtain the optimal scaffold design for a specific application, more insight should be achieved into the influence of biomaterials characteristics on the regeneration process.
