| Type of method | Other |

DESCRIPTION

Method keywords

veterinary medicine
skillslab training
dummy
mouth speculum
horse
dentistry

Scientific area keywords

Veterinary education
clinical training

Method description

In the skillslab, dummy models and simulators are used for teaching various clinical skills. A thorough teeth examination in horses requires the placement of a mouth speculum, which is a commonly performed procedure in equine veterinary practice. An important part of this training process can be performed on a simulator in the skillslab.

Lab equipment

Home-made dummy using a skull on a stand

Method status

History of use

Internally validated

PROS, CONS & FUTURE POTENTIAL

Advantages

The use of educational animal models in a skillslab offers a number of significant advantages:

- Reduced use of laboratory animals and reduced discomfort for patients, as procedures can be practised on dummy models and simulators before performing them on a live animal.
- Teaching of clinical skills in a quiet and safe environment, reducing anxiety and stress for the veterinary student.
- Complex practical skills can be split into a number of small steps when practising them in the skillslab

Challenges

- High cost of models
- Clinical training on live animals needed as well.
- Creating and repairing the home-made models is time consuming for a large group of students.
