

# The detection of cholestasis-inducing agents in cultured primary rat hepatocytes

Created on: 10-03-2019 - Last modified on: 28-02-2022

## PARTNERS AND COLLABORATIONS

# Organisation

Name of the organisation Vrije Universiteit Brussel (VUB)

**Department** Pharmaceutical and Pharmacological Sciences

Specific Research Group or Service In Vitro Toxicology and Dermato-Cosmetology

**Country** Belgium

**Geographical Area** Brussels Region

### **SCOPE OF THE METHOD**

The Method relates to	Human health
The Method is situated in	Basic Research, Translational - Applied Research
Type of method	In vitro - Ex vivo
Species from which cells/tissues/organs are derived	Rat
Type of cells/tissues/organs	Primary rat hepatocytes

#### DESCRIPTION

# Method keywords

Sandwich cultures Hepatocytes Bile salt export pump (Bsep) inhibition Cholyl-lysyl-fluorescein (CLF) Cholestasis-inducing potential

# Scientific area keywords

Toxicology
in vitro
Drug-induced liver injury (DILI)
cholestasis

# **Method description**

The standard operating procedure describes a method to assess the cholestasis-inducing potential of chemicals, in casu in cultures of primary rat hepatocytes. The procedure relies on the accumulation of the fluorescent bile salt export pump (Bsep) substrate cholyl-lysyl-fluorescein (CLF) in the canalicular network of sandwich-cultured rat hepatocytes either in presence or the absence of Bsep inhibitors.

# Lab equipment

Fluorescent microscope (Nikon Eclipse Ti-S, Belgium)

# PROS, CONS & FUTURE POTENTIAL

## **Advantages**

The standard operating procedure comprises an easy-to-apply method to detect cholestasis-inducing agents based on Bsep inhibition. Since sandwich cultures of hepatocytes, in contrast to conventional monolayer cultures, exhibit reformation of the canalicular network and polarized excretory functions, this culture systems forms an appropriate experimental setting for studying biliary excretion.

# Challenges

Most Bsep substrates, including CLF, cannot undergo efficient cellular translocation without the support of an uptake transporter, such as sodium-dependent taurocholate cotransporting polypeptide (Ntcp). A number of drugs, known to inhibit Bsep activity, also possess the ability to interfere with the Ntcp-mediated uptake of bile salts. This phenomenon should always be taken into account as it may

complicate the interpretation of the experimental results.
