

Immune phenotyping in the peripheral blood

Created on: 31-01-2020 - Last modified on: 03-03-2020

SCOPE OF THE METHOD

The Method relates to	Human health
The Method is situated in	Basic Research
Type of method	In vitro - Ex vivo
This method makes use of	Human derived cells / tissues / organs
Specify the type of cells/tissues/organs	Peripheral blood mononuclear cells

DESCRIPTION

Method keywords

flow cytometry

peripheral blood mononuclear cells

immune cell phenotyping

fluorescence

Scientific area keywords

Immunology

Autoimmunity

human white blood cells

Disease

health

Method description

Peripheral blood mononuclear cells (PBMC) are isolated from the peripheral blood using Ficoll gradient centrifugation. The PBMC are then stained with fluorescently-labelled monoclonal antibodies directed against cell surface or intracellular proteins that can be used to identify specific immune cell subtypes. Hereby, T cell subpopulations, B cell subpopulations, NK cell subpopulations and monocytes can be discriminated.

Lab equipment

Flow cytometer

Method status

Published in peer reviewed journal

PROS, CONS & FUTURE POTENTIAL

Advantages

Multi-parameter.

Modifications

Additional surface or intracellular markers can be added.
