

Humanized yeast models to study aspects related to Alzheimer's and Parkinson's disease

Commonly used acronym: Humanized yeast

Created on: 08-02-2020 - Last modified on: 11-02-2020

SCOPE OF THE METHOD

Method relates to	Human health
Method is situated in	Basic Research, Education and training, Translational - Applied Research
Type of method	In vitro - Ex vivo
This method makes use of	Other (e.g. bacteria): Yeast models based on expression of ABeta peptides, protein Tau, alpha-synuclein or Synphilin-1

DESCRIPTION

Method keywords

Yeast

ABeta42

Tau

MAPT

SNCA

Alpha-synuclein

Synphilin-1

screening

drug testing

cell death

protein folding

protein aggregation

Alzheimer

Parkinson

Scientific area keywords

neuroscience

neurodegeneration

Tauopathy

Alzheimer

Parkinson

Method description

We have developed and validated yeast models to study aspects related to protein folding diseases like Alzheimer's and Parkinson's disease. These models allow to gain further insight in the cellular processes involved in the etiology of these disorders and as such identify potential new bio-markers and targets for therapeutic intervention. These models also offer a screening platform to identify lead compounds, to test the efficacy of drugs or to perform mode-of-action studies.

Lab equipment

Standard yeast culture equipment ;

Multi-well microplate spectrophotometer/shaker.

Method status

Published in peer reviewed journal

PROS, CONS & FUTURE POTENTIAL

Advantages

Proven biological relevant eukaryotic system ;

Low cost compared to mammalian cell based systems.

Challenges

Unicellular model

Future & Other applications

Similar yeast based models can be developed for other disease areas, such as cancer.
